Abstract

A predictive maintenance method for determining a health status of a vehicular system included in a first vehicle is provided. A first dataset is collected for a plurality of vehicles. The first dataset is processed to determine a plurality of features corresponding to the vehicular system and a plurality of feature values for the plurality of features. A classifier is trained, based on the plurality of features, for determining the health status of the vehicular system. A second dataset including second operational data, second vehicle data, second trip data, and second service data for the first vehicle is collected. The second dataset is provided as input to the trained classifier. The health status of the vehicular system included in the first vehicle is determined based on an output of the trained classifier for the second dataset.

Abstract

Allocation Of A Vehicle To A Passenger Includes Receiving A Ride Request For A Ride From A Passenger Device Of A Passenger. A Ride Eligibility Of The Passenger Is Determined Based On Health Conditions Of The Passenger. Further, A Set Of Drivers Available For Offering The Ride Are Identified. A Subset Of Drivers Eligible For Offering The Ride Are Selected From The Set Of Drivers Based On At Least The Ride Request And Health Conditions Of Each Driver. A First Driver Is Selected From The Subset Of Drivers And A Route Is Selected From A Set Of Routes, Based On The Health Conditions Of The Passenger And Each Driver Of The Subset Of Drivers, Route Conditions Of Each Route, And The Ride Request. A Vehicle Associated With The First Driver Is Allocated To The Passenger For The Ride.

Abstract

A method for predictive maintenance of a component of a vehicle includes collection of first operational data, from a telematics device of the vehicle, for a set of parameters associated with the component. From the first operation data, a first dataset is selected based on an engine status of an engine of the vehicle. The first dataset is processed to obtain a plurality of feature values and the plurality of feature values are segregated into a plurality of clusters. A classifier is trained based on the plurality of clusters to determine the health status of the component. Real-time or near real-time operational data for the set of parameters is received, from the telematics device of the vehicle. The received operational data is used as an input to the trained classifier and the health status of the component is determined based on an output of the trained classifier.

Abstract

A method for facilitating vehicle servicing is provided. A first plurality of feature values corresponding to a first plurality of features are determined, for each of a plurality of vehicles. A second plurality of feature values corresponding to a second plurality of features are determined, for each of a plurality of service centers at which the plurality of vehicles were serviced. Based on the first and second pluralities of feature values, a machine learning model is trained to predict service completion times for servicing vehicles. For determining a service completion time for servicing a first vehicle at a first service center, a vehicular dataset of the first vehicle is provided as input to the machine learning model. The machine learning model predicts the service completion time based on the inputted vehicular dataset. The first vehicle is serviced at the first service center in compliance with the predicted service completion time.

Abstract

Generation of an autonomy map for assisting an autonomous vehicle includes extracting the historical autonomy information associated one or more route segments of one or more routes. An autonomy level for each route segment is determined based on the extracted historical autonomy information. A digital autonomy map is generated including each route segment of at least one route such that each route segment is tagged with the determined autonomy level. The autonomy level of each route segment is dynamically updated in real-time for providing real-time driving assistance to the autonomous vehicle.

Abstract

A Method And A System For Allocating Vehicles To Passengers Are Provided. Booking Requests For Rides Are Received From Passenger Devices Of Passengers. Available Vehicles Are Identified For Allocation Corresponding To The Booking Requests. A Matrix Is Generated In Which Each Element Corresponds To Each Booking Request-vehicle Pair. Each Element Is Determined Based On One Or More Parameter Values Corresponding To One Or More Parameters Associated With Each Booking Request-vehicle Pair And A Weight Associated With Each Parameter. The Matrix Is Further Processed By Means Of A Hungarian Algorithm To Generate Another Matrix. A Vehicle From The Available Vehicles Is Allocated To A Passenger From The Passengers Based On The Another Matrix.

Abstract

A method for asset health management is provided. The method includes receiving, first maintenance data, first booking data, first vehicle data, first operational data, and a labelled dataset for a set of vehicles over a first time-interval. The labelled dataset includes at least an actual health index for each vehicle observed over the first time-interval. The method includes determining a first plurality of features and a corresponding first plurality of feature values based on the first maintenance data, the first booking data, the first vehicle data, and the first operational data. The method includes training a prediction model based on the first plurality of features, the first plurality of feature values, and the labelled dataset. The method includes determining a health index of a target vehicle based on the trained first prediction model and a first dataset associated with the target vehicle.

Abstract

An authenticity detection method and system is provided for detecting an authenticity of a ride in a ride hailing environment. A set of geohashes is determined based on historical location data and a set of cell tower hashes is determined based on historical telecom data. A cellular network data corpus is generated based on the set of geohashes and the set of cell tower hashes. First location data and first telecom data are received from a driver device of a driver. A first geohash is determined based on the first location data and a first cell tower hash is determined based on the first telecom data. The authenticity of the ride is detected based on at least the cellular network data corpus, the first geohash, and the first cell tower hash.

Abstract

A System And A Method For Validating States Of One Or More Components Of A Vehicle Are Provided. The System Includes Circuitry That Receives An Event, Determines Associated Priority Level Based On First Mapping. The Circuitry Identifies The One Or More Components Associated With The Priority Level Based On A Second Mapping. The Circuitry Identifies One Or More Parameters Associated With Each Of The One Or More Components, And Generates A Query Message. The Query Message Is A Function Of Either The One Or More Components Or The One Or More Parameters. The Circuitry Transmits The Query Message To The Vehicle, And Receives The Values Of The One Or More Parameters From The Vehicle. The Circuitry Validates The State Of One Or More Components By Matching The Values Of The One Or More Parameters To Corresponding Stored Values Of The One Or More Parameters.

Abstract

A Method For Managing Multimedia Services Includes Transmitting A First Request By A First Device To A Communication Network For Reserving A Sub-channel Of A Communication Channel For A Multimedia Service. The First Device Transmits The First Request When The Multimedia Service Is Initiated At A Second Device. The First Device Communicates With The First Communication Network By Way Of The Communication Channel. The First Device Receives Data Associated With The Multimedia Service From The Second Device. The First Device Receives A First Acknowledgement From The First Communication Network. The First Acknowledgement Indicates A Reservation Of The Sub-channel For The Multimedia Service. The First Device Maps The Multimedia Service To The Sub-channel Based On The First Acknowledgement. The First Device Transmits The Data Over The Sub-channel, Thereby Managing A Quality Of Service For The Multimedia Service.

Abstract

A method for vehicle maintenance at a service center is provided. A set of vehicular datasets for a set of vehicles, at a service center, is retrieved from a database. Based on the set of vehicular datasets, a service schedule for servicing the set of vehicles is determined. The service schedule is indicative of a first sequence for servicing the set of vehicles. The servicing of a first subset of the set of vehicles is initiated based on the first sequence. A progress of the servicing of the first subset of the set of vehicles is monitored based on status reports. Based on the monitored progress, the service schedule for a second subset of the set of vehicles is updated. Based on the updated service schedule, the servicing of the second subset of the set of vehicles is initiated based on a second sequence.

Abstract

A method, system, and apparatus for troubleshooting one or more multimedia devices of an audio system have been disclosed herein. An audio loopback device transmits a test signal to a first multimedia device. The first multimedia device, after receiving the test signal, generates a response signal. The audio loopback device triggers a priority controller based on an unsuccessful detection of the response signal. The priority controller troubleshoots a communicative coupling by at least changing a mode of operation of at least one of a first multimedia device or a second multimedia device from a first mode of operation to a second mode of operation. The first mode of operation or the second mode of operation may be utilized by the first multimedia device to establish the communicative coupling with the second multimedia device for delivering an audio signal of the second multimedia device on an audio device.

Abstract

A method for augmenting transport services using event detection is provided. The method includes collection of first sensor data generated by various sensors associated with a plurality of vehicles. The first sensor data includes sensor outputs that indicate a plurality of rash driving events. The sensor outputs are augmented based on angular rotation to obtain augmented sensor outputs. A prediction model is trained based on the augmented sensor outputs. Target sensor data associated with a target vehicle is provided as input to the trained prediction model, and based on an output of the trained prediction model an occurrence of a rash driving event is detected in real-time or near real-time. Based on a count of rash driving events associated with the target driver within a cumulative driving distance, a driver score of the target driver is determined.

Abstract

A mobile ticketing method and system for providing mobile ticketing services to users is provided. A user selects a mobile ticket and initiates payment by using a user device. In response to successful processing of the payment, the user device receives encrypted QR data from a server. The user device decrypts and format the encrypted QR data to display a QR code. The QR code is scanned at a gate terminal associated with an entry or exit gate. The gate terminal validates the QR code and broadcasts data pertaining to the QR code via a BLE network. The user device verifies the gate terminal on receiving the broadcasted data via the BLE network, and transmits a connection request to the gate terminal. The gate terminal further validates the connection request and decides whether to allow or disallow the user to pass through the entry or exit gate.

Abstract

Methods and systems for allocating vehicles for rental rides to customers are provided. A booking request for a rental ride is received from a customer device of a customer. The booking request includes at least a ride distance and a ride duration specified by the customer. Based on the ride duration in the booking request, a predefined ride distance is determined for the rental ride. A ride fare for the rental ride is determined based on at least one of the ride duration, the ride distance specified by the customer, the predefined ride distance, a base fare, and a ride cost per unit distance. Upon confirmation of the ride fare by the customer, an available vehicle is allocated to the customer for rental ride.

Abstract

Vehicle allocation method and system for ride-sharing are provided. The method includes receiving a first set of booking requests is received, at a first time instance, from a set of customer devices for sharing one or more rides. A second set of booking requests is determined, at a second time instance, based on the first set of booking requests and a third set of booking requests. The third set of booking requests is determined based on at least one of historical booking data and booking requests received after the first time instance. A set of vehicles available for the one or more rides is determined at the second time instance. A graph is generated based on the second set of booking requests and the set of available vehicles. An available vehicle is allocated to one or more customers based on optimal matching between nodes of the graph.

Abstract

Optimizing performance of an autonomous vehicle (AV) includes acquiring information pertaining to a plurality of factors associated with the AV. The plurality of factors includes a route to be traversed by the AV for a ride, a type of a road included in the route, a real-time location of the AV, a time of travel, and a weather condition at the time of travel. An optimal configuration is selected based on the acquired information for operating components of the AV. The components are configured in real time to operate at the optimal configuration. When the components operate at the optimal configuration, a power consumed by the components is reduced and a durability of the components is increased relative to when the components operate at a first configuration that is different from the optimal configuration.

Abstract

A method and a system for allocating a vehicle to a user are provided. An availability of a vehicle is detected in a geographical location for an allocation. Based on the historical travel data or a real-time travel-related intention of a set of users in the geographical area, a user is identified from the set of users. A notification message is transmitted to a user device of the identified user based on the detected availability of the vehicle in the geographical area. A user response message is received from the user device in response to the transmitted notification message. Based on the received user response message associated with the selected user, the vehicle is allocated to the selected user for a ride.

Abstract

A method and a system for allocating vehicles to passengers in a ride-sharing system is provided. A passenger utilizes a passenger device to initiate a first phone call for booking a ride. The first phone call is initiated on a phone number associated with a pick-up location of the passenger. The first phone call is automatically disconnected, and a second phone call is established with the passenger device for providing a set of options selectable by the passenger. Based on an option selected by the passenger, a share-ride fare of the ride is communicated to the passenger during the second phone call. Based on the communicated share-ride fare, the passenger confirms the booking for the ride. In response to the confirmation of the booking for the ride, a vehicle is allocated to the passenger.

Abstract

A method and a system for predicting traffic conditions of a geographical area are provided. Position information, received from devices of corresponding vehicles that are traversing between road segments of a road network including at least first and second road segments, is located on a directed graph of the road network. Further, first and second times are determined based on the located position information on the directed graph. A traffic time of the first road segment is determined based on an average of time differences of the first and second times of each of the one or more first vehicles after filtering out a time period between the first and second times. The traffic conditions of the road network are predicted based on the determined traffic time of each of the road segments.

Abstract

A method and a system for maximizing share-ride bookings in a geographical area in a ride-sharing system are provided. Historical share-ride demands for the geographical area are estimated. A time period is segmented into time intervals such that each time interval has an equal count of the estimated historical share-ride demands. A conversion rate and a gross merchandise value (GMV) per unit of distance are determined for a first time interval at a check point of a second time interval. Error signals are generated at the check point based on deviations in the conversion rate and the GMV per unit of distance with respect to a defined conversion rate and a defined GMV per unit of distance, respectively. A share-ride fare in the second time interval is controlled based on the error signals to maximize the share-ride bookings during the second time interval.

Abstract

Calibration and distance prediction for driving assistance is provided. A camera of a vehicle is calibrated to obtain a distance data set. The distance data set includes a distance of each row of pixels of a first image captured by the camera. The distance data set may be further utilized in real-time to predict a distance of an object from the vehicle. Based on the predicted distance, a warning message for an impending collision may be generated and communicated to a driver of the vehicle, thereby facilitating driving assistance to the driver in the real-time.

Abstract

ABSTRACT SYSTEM AND METHOD FOR PARSING A POSTAL ADDRESS Approaches for parsing an unprocessed input address are described. Once obtained, the input address is subsequently processed to ascertain presence of different components, i.e., lower components and higher components, in the input address. On determining presence of any of the lower components, the corresponding lower component is removed from the input address. Once the processing of the input address to ascertain presence of all the lower components is complete, the input address is subsequently processed to ascertain presence of variety of higher components. On determining presence of any of the higher components, the corresponding component is removed from the input address. Thereafter, all the output components which have been identified in the input address are arranged in a predefined order to obtain an ordered input address. The ordered input address then may be provided to a geo-coder to determine geo-location coordinates corresponding to the input address

Abstract

ABSTRACT “A DETACHABLE SMART CONTAINER” The present invention provides a detachable smart container (1) which is composed of a housing body (2) having at least one door (2') and incorporates an array of sensors seamlessly which is integrated into the housing body (2) to measure a set of parameters. A plurality of modules are integrated into the detachable smart container (1) and the modules include but not limited to a smart lock module (6), which relays real-time information about the detachable smart container's door status, a monitoring module (7) configured to meticulously scrutinize the recorded parameters, promptly identifying any instances of abnormal activity, and even predicting an estimated time of arrival for the container. Lastly, an alarm module (8) is present to notify users about any identified abnormal activities in the detachable smart container. Figure 1 on sheet no. 1 of the drawings may accompany the abstract when published.

Abstract

A method for augmenting transport services using event detection is provided. The method includes collection of first sensor data generated by various sensors associated with a plurality of vehicles. The first sensor data includes sensor outputs that indicate a plurality of rash driving events. The sensor outputs are augmented based on angular rotation to obtain augmented sensor outputs. A prediction model is trained based on the augmented sensor outputs. Target sensor data associated with a target vehicle is provided as input to the trained prediction model, and based on an output of the trained prediction model an occurrence of a rash driving event is detected in real-time or near real-time. Based on a count of rash driving events associated with the target driver within a cumulative driving distance, a driver score of the target driver is determined.

A Method For Predictive Maintenance Of A Component Of A Vehicle Includes Collection Of First Operational Data, From A Telematics Device Of The Vehicle, For A Set Of Parameters Associated With The Component. From The First Operation Data, A First Dataset Is Selected Based On An Engine Status Of An Engine Of The Vehicle. The First Dataset Is Processed To Obtain A Plurality Of Feature Values And The Plurality Of Feature Values Are Segregated Into A Plurality Of Clusters. A Classifier Is Trained Based On The Plurality Of Clusters To Determine The Health Status Of The Component. Real-time Or Near Real-time Operational Data For The Set Of Parameters Is Received, From The Telematics Device Of The Vehicle. The Received Operational Data Is Used As An Input To The Trained Classifier And The Health Status Of The Component Is Determined Based On An Output Of The Trained Classifier.

Abstract

Methods And Systems For Allocating Vehicles For Rental Rides To Customers Are Provided. A Booking Request For A Rental Ride Is Received From A Customer Device Of A Customer. The Booking Request Includes At Least A Ride Distance And A Ride Duration Specified By The Customer. Based On The Ride Duration In The Booking Request, A Predefined Ride Distance Is Determined For The Rental Ride. A Ride Fare For The Rental Ride Is Determined Based On At Least One Of The Ride Duration, The Ride Distance Specified By The Customer, The Predefined Ride Distance, A Base Fare, And A Ride Cost Per Unit Distance. Upon Confirmation Of The Ride Fare By The Customer, An Available Vehicle Is Allocated To The Customer For Rental Ride.

Abstract

A Method, System, And Apparatus For Troubleshooting One Or More Multimedia Devices Of An Audio System Have Been Disclosed Herein. An Audio Loopback Device Transmits A Test Signal To A First Multimedia Device. The First Multimedia Device, After Receiving The Test Signal, Generates A Response Signal. The Audio Loopback Device Triggers A Priority Controller Based On An Unsuccessful Detection Of The Response Signal. The Priority Controller Troubleshoots A Communicative Coupling By At Least Changing A Mode Of Operation Of At Least One Of A First Multimedia Device Or A Second Multimedia Device From A First Mode Of Operation To A Second Mode Of Operation. The First Mode Of Operation Or The Second Mode Of Operation May Be Utilized By The First Multimedia Device To Establish The Communicative Coupling With The Second Multimedia Device For Delivering An Audio Signal Of The Second Multimedia Device On An Audio Device.

A Method And A System For Optimizing Inter-city Rides Are Provided. An Inter-city Booking Request For An Inter-city Ride Is Received From A Passenger Device Of A Passenger For Travelling From A First Geographical Area To A Second Geographical Area. In Response To The Received Inter-city Booking Request, Inter-city Demands Towards The First Geographical Area From Intermediate Geographical Areas Including The Second Geographical Area Are Predicted. Based On The Predicted Inter-city Demands And The Received Inter-city Booking Request, A Discounted Ride Fare For The Inter-city Ride Is Determined. A Confirmation Corresponding To The Discounted Ride Fare Is Received From The Passenger Device Of The Passenger For The Inter-city Ride. A Vehicle Is Allocated To The Passenger The Inter-city Ride Based On The Received Confirmation.

Abstract

A method for dynamic maintenance scheduling includes receiving, by a server, first maintenance data, first vehicle data, first booking data, and a plurality of maintenance plans associated with a plurality of vehicles. The plurality of maintenance plans is indicative of historical scheduled maintenance sessions of a corresponding vehicle of the plurality of vehicles. The method includes determination of a plurality of features and a corresponding plurality of feature values for each of the plurality of vehicles. The method includes training a prediction model based on the plurality of features and the corresponding feature values. The method includes determination of a maintenance criterion for a target vehicle based on the trained prediction model and a target dataset associated with the target vehicle. The maintenance criterion indicates an odometer reading range of the target vehicle during which a scheduled maintenance of the target vehicle is to be performed.

Abstract

ABSTRACT SYSTEM AND METHOD FOR PARSING A POSTAL ADDRESS Approaches for parsing an unprocessed input address are described. Once obtained, the input address is subsequently processed to ascertain presence of different components, i.e., lower components and higher components, in the input address. On determining presence of any of the lower components, the corresponding lower component is removed from the input address. Once the processing of the input address to ascertain presence of all the lower components is complete, the input address is subsequently processed to ascertain presence of variety of higher components. On determining presence of any of the higher components, the corresponding component is removed from the input address. Thereafter, all the output components which have been identified in the input address are arranged in a predefined order to obtain an ordered input address. The ordered input address then may be provided to a geo-coder to determine geo-location coordinates corresponding to the input address. <>

Abstract

A method for facilitating vehicle servicing is provided. A first plurality of feature values corresponding to a first plurality of features are determined, for each of a plurality of vehicles. A second plurality of feature values corresponding to a second plurality of features are determined, for each of a plurality of service centers at which the plurality of vehicles were serviced. Based on the first and second pluralities of feature values, a machine learning model is trained to predict service completion times for servicing vehicles. For determining a service completion time for servicing a first vehicle at a first service center, a vehicular dataset of the first vehicle is provided as input to the machine learning model. The machine learning model predicts the service completion time based on the inputted vehicular dataset. The first vehicle is serviced at the first service center in compliance with the predicted service completion time.
